#### **VECTOR & MATRIX NORMS**

- Inner products
- Vector norms
- Matrix norms
- Introduction to singular values
- Expressions of some matrix norms.

2-1

## Inner products and Norms

Inner product of 2 vectors

 $\blacktriangleright$  Inner product of 2 vectors x and y in  $\mathbb{R}^n$ :

$$x_1y_1+x_2y_2+\cdots+x_ny_n$$
 in  $\mathbb{R}^n$ 

Notation: (x,y) or  $y^Tx$ 

➤ For complex vectors

$$(x,y)=x_1ar{y}_1+x_2ar{y}_2+\cdots+x_nar{y}_n$$
 in  $\mathbb{C}^n$ 

Note:  $(x,y) = y^H x$ 

ullet On notation: Sometimes you will find  $\langle .,. 
angle$  for (.,.) and  $A^*$  instead of  $A^H$ 

GvL 2.2-2.3; - Norms

## Properties of Inner Product:

- $ightharpoonup (x,y) = \overline{(y,x)}$ .
- $ightharpoonup (\alpha x + \beta y, z) = \alpha(x, z) + \beta(y, z)$  [Linearity]
- $ightharpoonup (x,x) \geq 0$  is always real and non-negative.
- (x,x)=0 iff x=0 (for finite dimensional spaces).

ightharpoonup Given  $A \in \mathbb{C}^{m \times n}$  then

$$(Ax,y)=(x,A^Hy) \ \ orall \ x \ \in \ \mathbb{C}^n, orall y \ \in \ \mathbb{C}^m$$

2-3 GvL 2.2-2.3; - Norms

2-3

 $\blacktriangleright$  A vector norm on a vector space  $\mathbb{X}$  is a real-valued function on  $\mathbb{X}$ , which satisfies the following three conditions:

- $1. \, \|x\| \geq 0, \quad \forall \, \, x \, \in \, \, \mathbb{X}, \quad \text{and} \quad \|x\| = 0 \, \, \text{iff} \, \, x = 0.$
- 2.  $\|\alpha x\| = |\alpha| \|x\|, \quad \forall x \in \mathbb{X}, \quad \forall \alpha \in \mathbb{C}.$
- 3.  $||x + y|| \le ||x|| + ||y||$ ,  $\forall x, y \in X$ .
- ➤ Third property is called the triangle inequality.

Vector norms

Norms are needed to measure lengths of vectors and closeness of two vectors. Examples of use: Estimate convergence rate of an iterative method; Estimate the error of an approximation to a given solution;

2-3 \_\_\_\_\_\_ GvL 2.2-2.3; - Norms

2-3

Important example: Euclidean norm on  $\mathbb{X} = \mathbb{C}^n$ ,

$$\|x\|_2 = (x,x)^{1/2} = \sqrt{|x_1|^2 + |x_2|^2 + \ldots + |x_n|^2}$$

Show that when Q is orthogonal then  $\|Qx\|_2 = \|x\|_2$ 

4 \_\_\_\_\_\_ GvL 2.2-2.3; - Norms

2-4

GvL 2.2-2.3; - Norms

Most common vector norms in numerical linear algebra: special cases of the Hölder norms (for  $p \geq 1$ ):

$$\|x\|_p = \left(\sum_{i=1}^n |x_i|^p
ight)^{1/p}.$$

Find out (online search) how to show that these are indeed norms for any  $p \ge 1$  (Not easy for 3rd requirement!)

2-5 GvL 2.2-2.3; - Norms

2-5

➤ The Cauchy-Schwartz inequality (important) is:

$$|(x,y)| \leq ||x||_2 ||y||_2$$
.

- When do you have equality in the above relation?
- Expand (x + y, x + y). What does the Cauchy-Schwarz inequality imply?

Property:

ightharpoonup Limit of  $\|x\|_p$  when  $p o \infty$  exists:

$$\lim_{p \to \infty} \|x\|_p = \max_{i=1}^n |x_i|$$

- $\triangleright$  Defines a norm denoted by  $\|\cdot\|_{\infty}$ .
- The cases p=1, p=2, and  $p=\infty$  lead to the most important norms  $\|\cdot\|_p$  in practice. These are:

$$\|x\|_1 = |x_1| + |x_2| + \dots + |x_n|, \ \|x\|_2 = \left[|x_1|^2 + |x_2|^2 + \dots + |x_n|^2\right]^{1/2}, \ \|x\|_\infty = \max_{i=1,\dots,n} |x_i|.$$

2-6 \_\_\_\_\_ GvL 2.2-2.3; - Norms

2-6

 $\triangleright$  The Hölder inequality (less important for  $p \neq 2$ ) is:

$$|(x,y)| \leq \|x\|_p \|y\|_q$$
 , with  $rac{1}{p} + rac{1}{q} = 1$ 

Proof moved to supplement set #2.

Second triangle inequality:  $||x|| - ||y|| | \le ||x - y||$ .

Consider the metric  $d(x,y) = max_i|x_i - y_i|$ . Show that any norm in  $\mathbb{R}^n$  is a continuous function with respect to this metric.

#### Equivalence of norms:

In finite dimensional spaces  $(\mathbb{R}^n, \mathbb{C}^n, ...)$  all norms are 'equivalent': if  $\phi_1$  and  $\phi_2$  are two norms then there exists positive constants  $\alpha, \beta$  such that:

$$\beta \phi_2(x) \le \phi_1(x) \le \alpha \phi_2(x)$$
.

Mow can you prove this result? [Hint: Show for  $\phi_2 = \|.\|_{\infty}$ ]

-7 GvL 2.2-2.3; – Norm:

2-7

## Convergence of vector sequences

A sequence of vectors  $x^{(k)}$ ,  $k=1,\ldots,\infty$  converges to a vector x with respect to the norm  $\|.\|$  if, by definition,

$$\lim_{k o\infty}\ \|x^{(k)}-x\|=0$$

- Important point: because all norms in  $\mathbb{R}^n$  are equivalent, the convergence of  $x^{(k)}$  w.r.t. a given norm implies convergence w.r.t. any other norm.
- ➤ Notation:

$$\lim_{k o\infty}x^{(k)}=x$$

We can bound one norm in terms of any other norm.

Show that for any x:  $\frac{1}{\sqrt{n}} \|x\|_1 \leq \|x\|_2 \leq \|x\|_1$ 

What are the "unit balls"  $B_p = \{x \mid ||x||_p \le 1\}$  associated with the norms  $||.||_p$  for  $p = 1, 2, \infty$ , in  $\mathbb{R}^2$ ?

2-8 GvL 2.2-2.3; - Norms

2-8

**Example:** The sequence

$$x^{(k)} = egin{pmatrix} 1+1/k \ rac{k}{k+\log_2 k} \ rac{1}{k} \end{pmatrix}$$

converges to

$$x = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$$

Note: Convergence of  $x^{(k)}$  to x is the same as the convergence of each individual component  $x_i^{(k)}$  of  $x^{(k)}$  to the corresponding component  $x_i$  of x.

GvL 2.2-2.3; – Norms

GvL 2.2-2.3; - Norms

#### Matrix norms

- ightharpoonup Can define matrix norms by considering  $m \times n$  matrices as vectors in  $\mathbb{R}^{mn}$ . These norms satisfy the usual properties of vector norms, i.e.,
  - 1.  $||A|| \geq 0$ ,  $\forall A \in \mathbb{C}^{m \times n}$ , and ||A|| = 0 iff A = 0
  - 2.  $\|\alpha A\| = |\alpha| \|A\|, \forall A \in \mathbb{C}^{m \times n}, \ \forall \ \alpha \in \mathbb{C}$
  - 3.  $||A + B|| < ||A|| + ||B||, \forall A, B \in \mathbb{C}^{m \times n}$ .
- ➤ However, these will lack (in general) the right properties for composition of operators (product of matrices).
- $\triangleright$  The case of  $\|.\|_2$  yields the Frobenius norm of matrices.

2-11 GvL 2.2-2.3; - Norms

2-11

Consistency / sub-mutiplicativity of matrix norms

➤ A fundamental property of matrix norms is consistency

$$||AB||_p \leq ||A||_p ||B||_p$$
.

[Also termed "sub-multiplicativity"]

- ightharpoonup Consequence: (for square matrices)  $\overline{\|A^k\|_p \leq \|A\|_p^k}$
- igwedge  $A^k$  converges to zero if any of its p-norms is < 1

[Note: sufficient but not necessary condition]

• Given a matrix A in  $\mathbb{C}^{m\times n}$ , define the set of matrix norms

$$\|A\|_p = \max_{x \in \mathbb{C}^n, \; x 
eq 0} rac{\|Ax\|_p}{\|x\|_p}.$$

- These norms satisfy the usual properties of vector norms (see previous page).
- The matrix norm  $\|.\|_p$  is induced by the vector norm  $\|.\|_p$ .
- ightharpoonup Again, important cases are for  $p=1,2,\infty$  .
- lacksquare Show that  $\|A\|_p = \max_{x \in \mathbb{C}^n, \; \|x\|_p = 1} \; \|Ax\|_p$

2-12 GvL 2.2-2.3; - Norms

2-12

#### Frobenius norms of matrices

➤ The Frobenius norm of a matrix is defined by

$$\|A\|_F = \left(\sum_{j=1}^n \sum_{i=1}^m |a_{ij}|^2 
ight)^{1/2}$$
 .

- $\triangleright$  Same as the 2-norm of the column vector in  $\mathbb{C}^{mn}$  consisting of all the columns (respectively rows) of A.
- ➤ This norm is also consistent [but not induced from a vector norm]

2-13 \_\_\_\_\_\_ GvL 2.2-2.3; - Norms

GvL 2.2-2.3; - Norms

2-13

∠onpute the Frobenius norms of the matrices

$$\begin{pmatrix} 1 & 1 \\ 1 & 0 \\ 3 & 2 \end{pmatrix} \quad \begin{pmatrix} 1 & 2 & -1 \\ -1 & \sqrt{5} & 0 \\ -1 & 1 & \sqrt{2} \end{pmatrix}$$

Prove that the Frobenius norm is consistent [Hint: Use Cauchy-Schwartz]

Define the 'vector 1-norm' of a matrix A as the 1-norm of the vector of stacked columns of A. Is this norm a consistent matrix norm?

[Hint: Result is true – Use Cauchy-Schwarz to prove it.]

2-15 GvL 2.2-2.3; - Norm

2-1

Compute the p-norm for  $p=1,2,\infty,F$  for the matrix  $A=egin{pmatrix} 0&2\\0&1 \end{pmatrix}$ 

Show that  $\rho(A) \leq \|A\|$  for any matrix norm.

#### Expressions of standard matrix norms

Recall the notation: (for square  $n \times n$  matrices)  $ho(A) = \max |\lambda_i(A)|; \quad \operatorname{Tr}(A) = \sum_{i=1}^n a_{ii} = \sum_{i=1}^n \lambda_i(A)$  where  $\lambda_i(A)$ ,  $i=1,2,\ldots,n$  are all eigenvalues of A

$$\|A\|_1 = \max_{j=1,...,n} \sum_{i=1}^m |a_{ij}|,$$
  $\|A\|_{\infty} = \max_{i=1,...,m} \sum_{j=1}^n |a_{ij}|,$   $\|A\|_2 = \left[
ho(A^HA)
ight]^{1/2} = \left[
ho(AA^H)
ight]^{1/2},$   $\|A\|_F = \left[\operatorname{Tr}(A^HA)
ight]^{1/2} = \left[\operatorname{Tr}(AA^H)
ight]^{1/2}.$ 

-16 \_\_\_\_\_\_ GvL 2.2-2.3; — Norms

2-1

1.  $\rho(A) = \|A\|_2$  when A is Hermitian  $(A^H = A)$ .  $\blacktriangleright$  True for this particular case...

2. ... However, not true in general. For  $A=\begin{pmatrix}0&1\\0&0\end{pmatrix}$ , we have  $\rho(A)=0$  while  $A\neq 0$ . Also, triangle inequality not satisfied for the pair A, and  $B=A^T$ . Indeed,  $\rho(A+B)=1$  while  $\rho(A)+\rho(B)=0$ .

Given a function f(t) (e.g.,  $e^t$ ) how would you define f(A)? [Was seen earlier. Here you need to fully justify answer. Assume A is diagonalizable]

GvL 2.2-2.3; - Norms

# Singular values and matrix norms

- ightharpoonup Let  $A \in \mathbb{R}^{m imes n}$  or  $A \in \mathbb{C}^{m imes n}$
- $\blacktriangleright$  Eigenvalues of  $A^HA \& AA^H$  are real > 0. 6 Show this.
- $lacksquare egin{aligned} lacksquare ext{Let} & \left\{egin{aligned} m{\sigma}_i = \sqrt{\lambda_i(AA^H)} & i = 1, \cdots, n & ext{if } n \leq m \ m{\sigma}_i = \sqrt{\lambda_i(AA^H)} & i = 1, \cdots, m & ext{if } m < n \end{aligned} 
  ight.$
- ightharpoonup The  $\sigma_i$ 's are called singular values of A.
- $\triangleright$  Note: a total of  $\min(m, n)$  singular values.
- lacksquare Always sorted decreasingly:  $\sigma_1 \geq \sigma_2 \geq \sigma_3 \geq \cdots \sigma_k \geq \cdots$
- We will see a lot more on singular values later

18 \_\_\_\_\_ GvL 2.2-2.3; - Norm

2-18

- More generally: Schatten p-norm  $(p \geq 1)$  defined by  $\|A\|_{*,p} = \left[\sum_{i=1}^r \sigma_i^p\right]^{1/p}$
- ightharpoonup Note:  $\|A\|_{*,p}=p$ -norm of vector  $[\sigma_1;\sigma_2;\cdots;\sigma_r]$
- In particular:  $||A||_{*,1} = \sum \sigma_i$  is called the nuclear norm and is denoted by  $||A||_{*}$ . (Common in machine learning).

ightharpoonup Assume we have r nonzero singular values (with  $r \leq \min\{m,n\}$ ) :

$$\sigma_1 \geq \sigma_2 \geq \cdots \geq \sigma_r > 0$$

➤ Then:

$$ullet \|A\|_2 = \sigma_1 \ ullet \|A\|_F = \left[\sum_{i=1}^r \sigma_i^2
ight]^{1/2}$$

GvL 2.2-2.3; - Norms

2-18

# A few properties of the 2-norm and the F-norm

- ightharpoonup Let  $A=uv^T$ . Then  $\|A\|_2=\|u\|_2\|v\|_2$
- ∠
   Prove this result

For any  $A\in\mathbb{C}^{m\times n}$  and unitary matrix  $Q\in\mathbb{C}^{m\times m}$  we have  $\|QA\|_2=\|A\|_2; \quad \|QA\|_F=\|A\|_F.$ 

19 GvL 2.2-2.3; - Norm
